

Self-cooling Motor-independent Frequency Inverter

PumpDrive 2 Eco

Application Guide

Application Guide

PumpDrive 2 Eco

The use cases in the application guide are only typical examples for training purposes. The examples are not customer specific solutions. The examples are not binding and can be incomplete. The examples do not cover all possible eventualities. The examples do not cover all design details and variants, nor do they cover all scenarios and situations that may arise during installation, operation or maintenance. The application guide is not replacing the operating manual. In any case of divergence the operating manual has higher priority. The operator must take care about the appropriate operation referring to the operating manual. The examples do not excuse from the save operating, installation and service. Changes of this application guide will be done without announcement.

1. Pre-Conditions

- The motor data are set according to the operating manual.
- The motor control is correctly selected and suits to the motor.
- The pump curves are stored in the drive.

Pre-settings from production

Pumps with PumpDrive are delivered with the following pre-settings:

- Motor data
- Motion control according to motor type
- Pre-setting of PumpMeter including sensors
- Pump curves

Type series	Etaline / Etaline Z	Etanorm, Etabloc, Etachrom Multitec, Movitec, Sewatec	Retrofit Drive	PumpDrive spare part
selection	EasySelect	EasySelect	EasySelect	Material number
Motor data	preset	preset	Preset	-
Asynchronous motor	Vector ASM	Vector ASM	Vector ASM	-
SuPremE	Vector SuPremE	Vector SuPremE	Vector SuPremE	Vector SuPremE
with PumpMeter	Closed loop control: Differential pressure and sensors preset	Closed loop control: pressure p constant and sensors preset	-	-
without PumpMeter	Open-loop Control	Open-loop Control	Open-loop Control	Open-loop Control
Pump curve	preset	preset	-	-
Setpoint	with PumpMeter: preset	with PumpMeter: preset	-	-

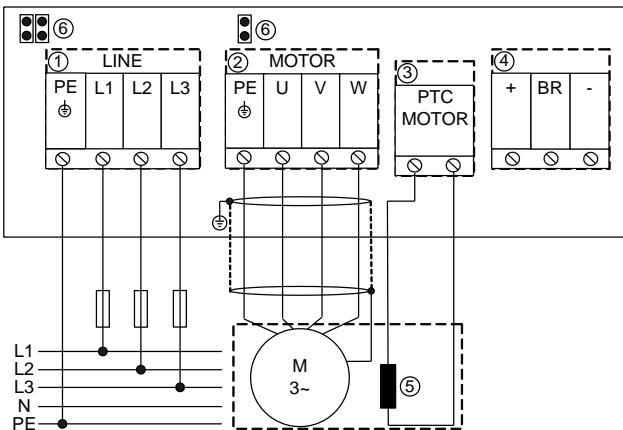

Retrofit PumpDrives, which will be selected in EasySelect, will be delivered only with motor data (work in progress). The pump curves must be parameterized on site, can be uploaded from PumpMeter, can be set from ServiceTool or display.

PumpDrives (spare parts), which are ordered by material numbers are not parameterized in the production.

Using a 0/4...20mA or 0/2...10V Sensor for control a PumpMeter can be used as internal sensor in parallel. PumpMeter used as internal sensor improves the flow estimation.

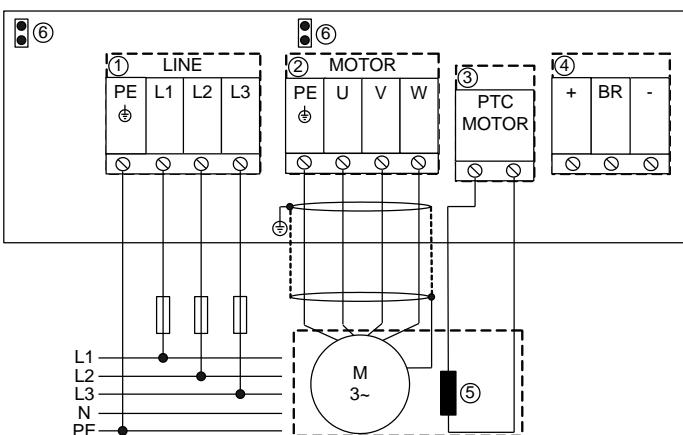

Connecting mains and motor

Standard Display

For the parameterization of the following applications the user must be logged in Customer Level.

Customer Login in Favourite Menu:

By pressing the button OK Taste  the user selects the Favourite Menu, where the main parameters can be changed.

Main Screen

By pressing up and down buttons, the user can navigate through the Favourite Menu.

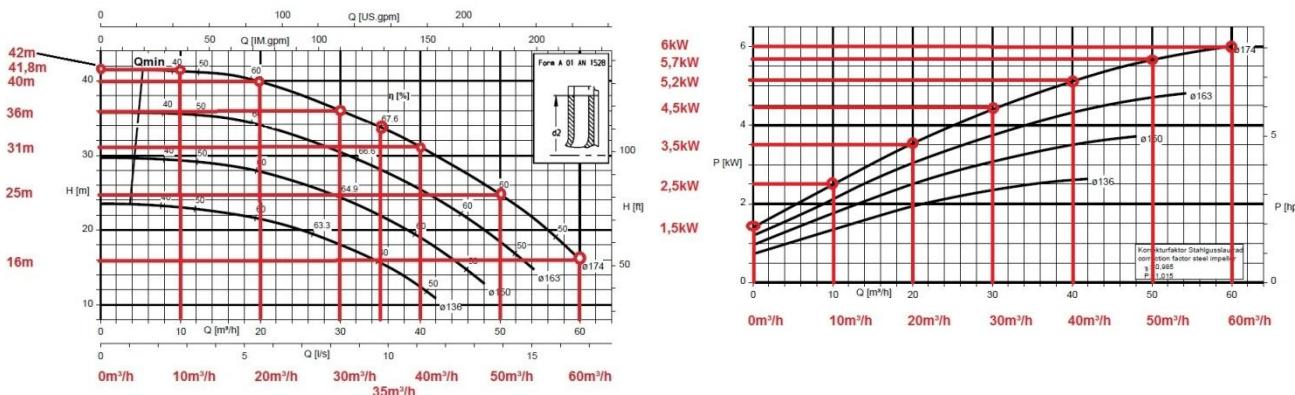

Settings:

By pressing ESC  and OK  at the same time, the user selects the first menu level, where he can navigate through the different menus and parameters.

1.1.1 Pump characteristic curve

The pump characteristic curve for an Etaline 040-040-160 with full impeller diameter 174 has to be set manually. The values for the pump characteristic curves are readout of the type series booklet at nominal speed of the pump with impeller diameter 174.

Etaline 40-40-160, $n = 2900 \text{ min}^{-1}$

2) Pre-settings for completely assembled pump, motor, drive

1.1.2 *Parameterization of Motor data*

A PumpDrive 2 is parameterized for a 2 pole SuPremE Motor. The pump rotation is clockwise.

Name plate of motors:

Nr.	Parameter	Change value to	Pre-settings by factory ²⁾	Changeable by

1) Digital Input 1 is set as at the factory as system start. If a digital input is set as system start, the parameter 1-3-1 System start is automatically without function (see control point concept in operating manual)

2) Pre-settings for completely assembled pump, motor, drive

2.1.2 Open loop control: control value by external signal 0...10V

A fixed speed of 2000 1/min should be given by an external signal 0...10V at analog input 1.
 2000 1/min is equal to 6,78 V when using a 2-pole motor with a nominal speed of 2950 1/min.
 Information: the set point can't be lower than the minimum speed.

Nr.	Function
16	Enable power electronic
17	Ground for digital inputs
11	System start with DI1 ¹⁾
2	Set point (open loop): external signal 0...10V
18	Alarm

1) Digital Input 1 is set as at the factory as system start. If a digital input is set as system start, the parameter 1-3-1 System start is automatically without function (see control point concept in operating manual)

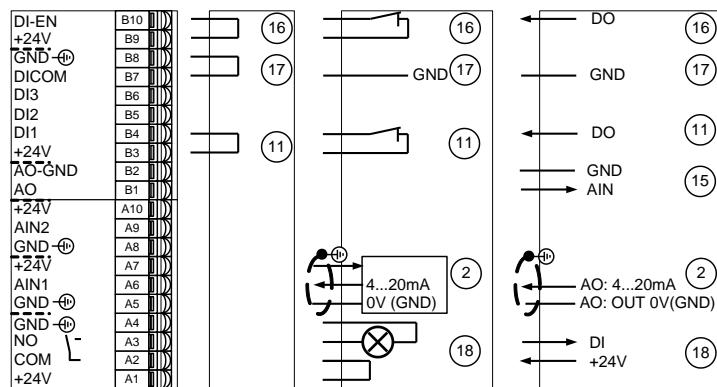

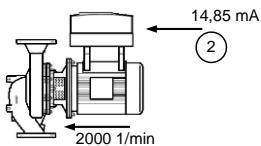

2) Pre-settings for completely assembled pump, motor, drive

2.1.3 Open loop control: control value by external signal 4...20mA

A fixed speed of 2000 1/min should be given by an external signal 4...20mA at analog input 1.

The feedback of the speed should be send by analog output to a PLC.

2000 1/min is equal to 14,85 mA when using a 2-pole motor with a nominal speed of 2950 1/min (16mA / 2950 rpm * 2000 rpm + 4 mA = 14,85 mA). Information: the set point can't be lower than the minimum speed

Nr.	Function
16	Enable power electronic
17	Ground for digital inputs
11	System start with DI ¹⁾

1) Digital Input 1 is set as at the factory as system start. If a digital input is set as system start, the parameter 1-3-1 System start is automatically without function (see control point concept in operating manual)

2) Pre-settings for completely assembled pump, motor, drive

2.2.5 Closed loop control: Sensorless differential pressure control

A constant differential pressure of 4 bar is needed without using a sensor. The set point is given by the display. The procedure is based on the characteristic curves of the pump. Steep power curves are conducive to high process accuracy. The process is suitable to a limited extent if sections of the power curve are constant over the flow rate. To facilitate sensorless differential pressure control, all parameters of the pump characteristic curves (3-4-1, 3-4-3-1 to 3-4-3-22) and the pipe diameters (3-5-2-1 und 3-5-2-2) must be entered. All needed parameters for the flow rate estimation like pipe diameters are preset in the pump production when ordering a completely assembled pump, motor and drive.

3.2.3 Closed loop control redundant: Discharge pressure with sensor 4...20mA and PumpMeter each pump

Etaline / Etabloc (2x100%): In a multi pump system with three pumps a constant pressure of 4bar is needed. The 4...20mA pressure sensor with a measurement range of 0-6 bar placed in the manifold is connected in parallel to each analog input 2 of Master and AuxMaster1. The AuxMaster can take over control if the Master fails. When connecting a 4...20mA sensor in parallel to all drives the 4...20mA current signal must be converted to 2...10V voltage signal: therefore the DIP switch of the analog input 2 of the Master must be set to "ON"³⁾. Each pump uses PumpMeter as an internal sensor -1 to 6bar, which is not used for the control. The set point is given by the display.

1) Digital Input 1 is set as at the factory as system start. If a digital input is set as system start, the parameter 1-3-1 System start is automatically without function (see control point concept in operating manual)

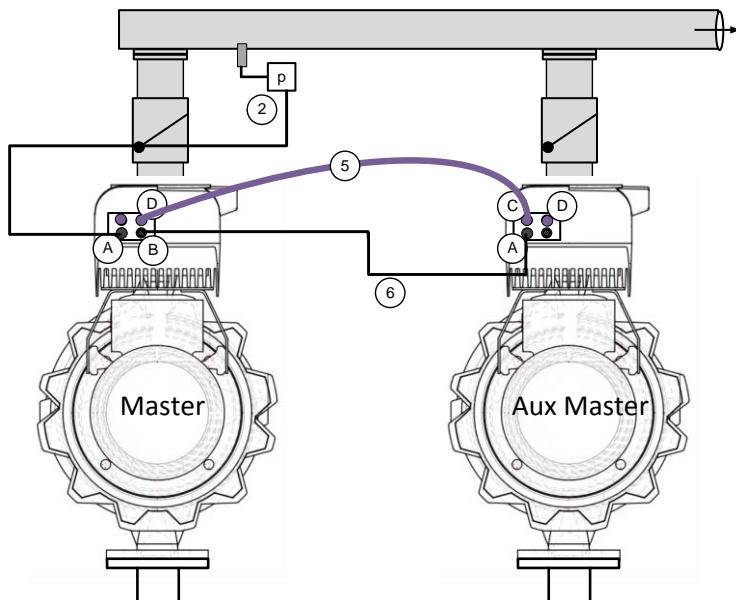

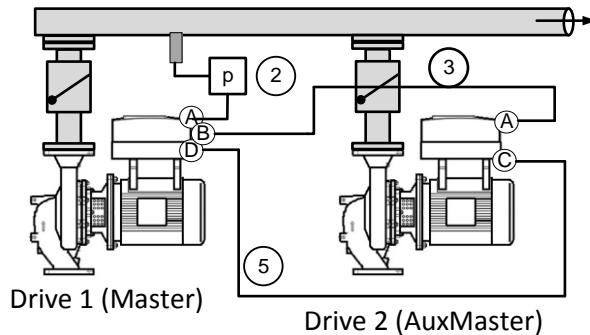

2) Pre-settings for completely assembled pump, motor, drive

3) On all drives will be the 4...20mA signal converted to 2...10V signal, if the DIP switch in the Master is set to „ON“

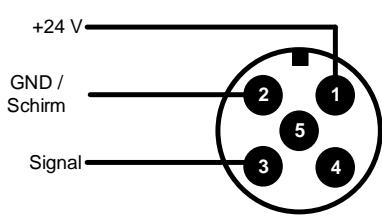

4) If PumpMeter is only used as an internal measured variable at input A of the M12 module (via Modbus) and not for control, the Function M12 Module Input A parameter (3-8-4-1) must be set to PMtr Internal Suction/Discharge Pressure.

3.2.4 Closed loop control redundant: Discharge pressure with pressure sensor 4...20mA via M12

Etaline / Etabloc (2x100%): In a multi pump system with three pumps a constant pressure of 4bar is needed. The 4...20mA pressure sensor with a measurement range of 0-6 bar placed in the manifold is connected in parallel to each analog input 2 of Master and AuxMaster1. The AuxMaster can take over control if the Master fails. When connecting a 4...20mA sensor in parallel to all drives the 4...20mA current signal must be converted to 2...10V voltage signal: therefore the DIP switch of the analog input 2 of the Master must be set to "ON"³⁾. The set point is given by the display. After 24 h the pumps switch automatically.

1) Digital Input 1 is set as at the factory as system start. If a digital input is set as system start, the parameter 1-3-1 System start is automatically without function (see control point concept in operating manual)

2) Pre-settings for completely assembled pump, motor, drive

3) On all drives will be the 4...20mA signal converted to 2...10V signal, if the DIP switch in the Master is set to „ON“

4) If there is a cross link cable for the redundant connection of the pressure sensor, only one switch CURR-IN should be set to ON. So the 4...20mA signal will be converted to 2...10V signal.

5) If an additional sensor is connected to the AUX master the DIP switch should be ON.

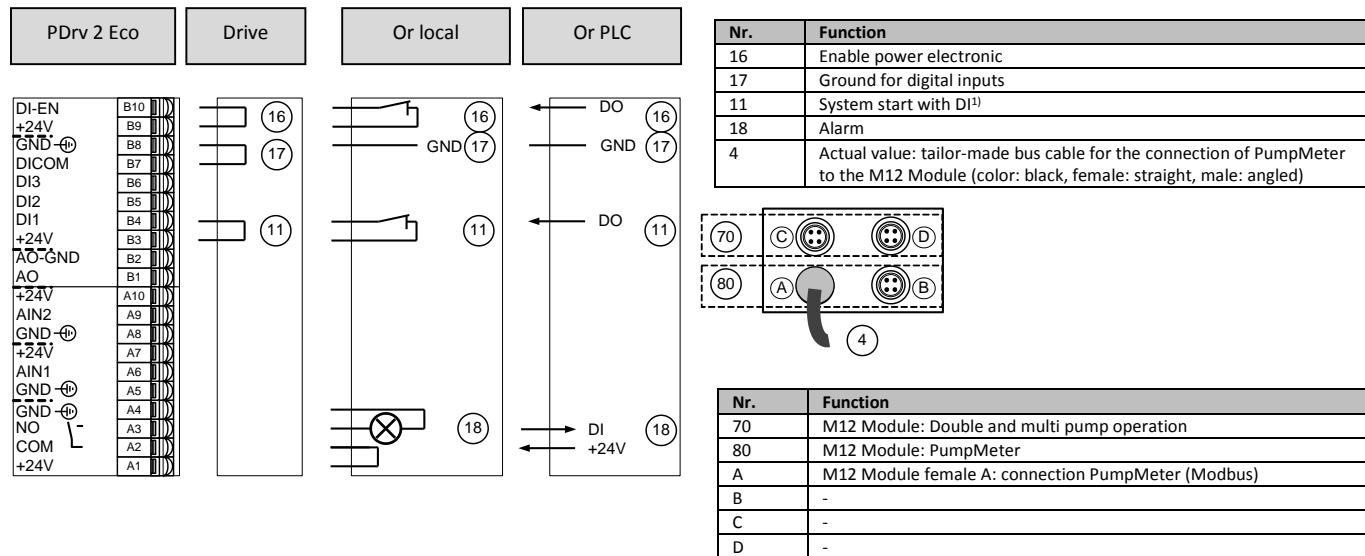

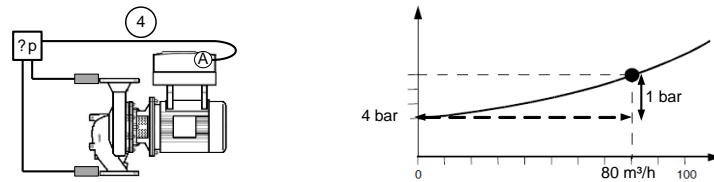

DIP Switch M12 Module Drive 2

4. Pump functionality

4.1 Closed loop control

4.1.1 Closed loop control: dynamic differential pressure set point compensation based on flow rate estimation

A constant differential pressure of 4 bar is needed. PumpMeter is used as a differential pressure sensor in the measurement range of -1 ... 10 bar. PumpMeter is connected by Modbus to the M12 Module of the drive. The set point is given by the display. For the optimal energy saving the "dynamic differential pressure set point compensation based on flow rate estimation" is activated. The nominal flow is 80 m³/h. The pipe friction losses are roundabout 1 bar. All parameters needed for the flow estimation like pipe diameters are preset individually for each pump size by the pump production when ordering a completely assembled pump, motor, drive.

2) Pre-settings for completely assembled pump, motor, drive and PumpMeter

4.1.2 Closed loop control: dynamic differential pressure set point compensation based on speed

A constant differential pressure of 4 bar is needed. The 4...20mA differential pressure sensor with a measurement range of 0-6 bar is connected to analog input 2. The set point is given by the display. If neither the measured nor estimated flow rate is available, dynamic pressure setpoint compensation can be realized based on speed. This is only possible for closed hydraulic circuits, however. The nominal flow is 80 m³/h. The pipe friction losses are roundabout 1 bar. All parameters needed for the flow estimation like pipe diameters are preset individually for each pump size by the pump production when ordering a completely assembled pump, motor, drive.

Nr.	Parameter	Change value to	Pre-settings by factory 2)	Changeable by

1) Digital Input 1 is set as at the factory as system start. If a digital input is set as system start, the parameter 1-3-1 System start is automatically without function (see control point concept in operating manual)

2) Pre-settings for completely assembled pump, motor, drive

4.1.3 Open loop control: 1 fix speed selected by digital switches or variable speed via analog signal

A fixed speed of 2000 1/min should be set on the display. The nominal speed of the 2 pole motor is 2950 1/min.

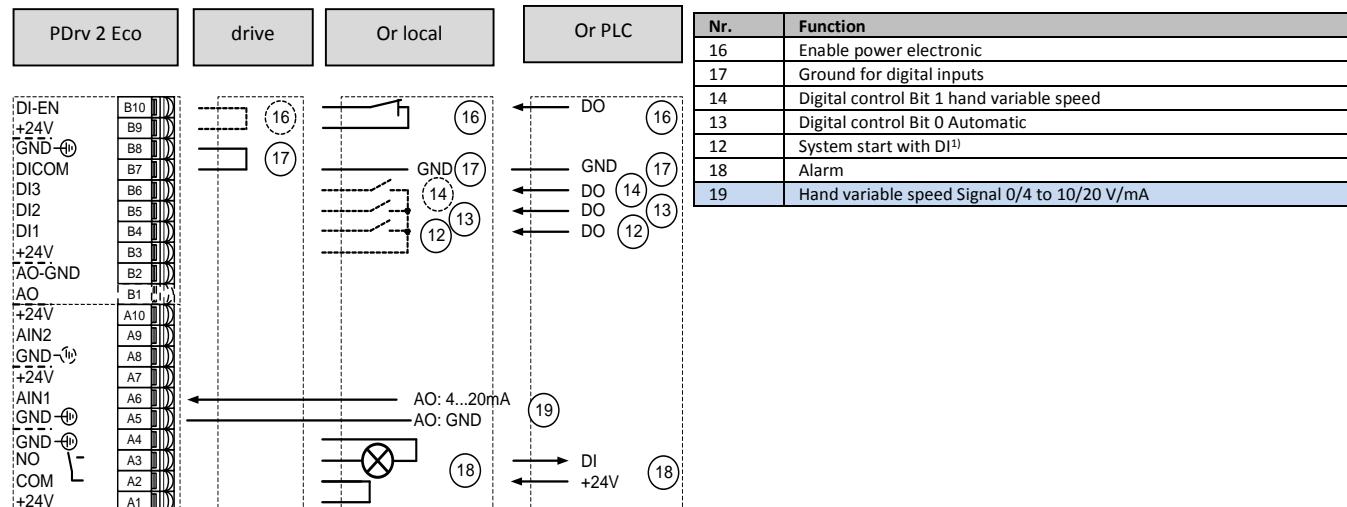

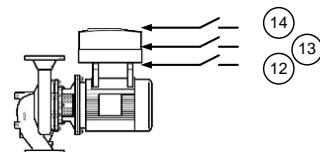

1 additional fixed speeds and OFF should be selectable by local digital switches:

Attention: The drive must now always be turned on via the digital inputs by selecting auto zero or Man

The keyboard will be blocked when you select this function

		DI 1 Automatic Run	DI 2: Control Digital Bit 0	DI 3: Control Digital Bit 1
All DI on 0	Off	0	0	0
Automatic only Bit 0 DI 2 on 1	Automatic	0	1	0
Automatic Start Bit 0 DI 2 on 1 and DI 1 on f 1	Automatic Start System	1	1	0
Hand variable speed only Bit 1 DI 3 on 1	Hand (variable speed)	0	0	1
Fix speed e.g. 2950 1/min DI 2 + 3 Bit 0 and 1 on 1	Hand (fix speed 1)	0	1	1

Info: by selecting a fixed speed the drive changes to manual operation. The Auto button at the display is then out of function (see also control point concept)

2) Pre-settings for completely assembled pump, motor, drive

4.1.4 Closed loop control: sleep Mode

A constant differential pressure of 4 bar is needed. PumpMeter is used as a differential pressure sensor in the measurement range of -1 ... 10 bar. PumpMeter is connected by Modbus to the M12 Module of the drive. The set point is given by the display. The frequency inverter stops the pump without setpoint increase in the case of low flow rates, i.e. when the low flow limit or stop speed is reached: Sleep mode without setpoint increase. Sleep mode is only active in the automatic operation.

		5 m	01651182
		10 m	01651183
		20 m	01651184

Self-made bus cable for the connection for double and multi pump operation:

Nr.	function	length	Mat.-Nr.
51	PumpDrive 2 (Drive 1) with M12 Module – Connector D		
52	PumpDrive 2 (Drive 2) with M12 Module – Connector C		
61	CAN-Bus cable cut to length, screened, twisted pair, cable 2 x 2 x 0,22 mm ²	1 m	01111184
		5 m	01304511
		10 m	01304512
		20 m	01304513
M, N	M12 male, A-coded, 5 poles		01523004

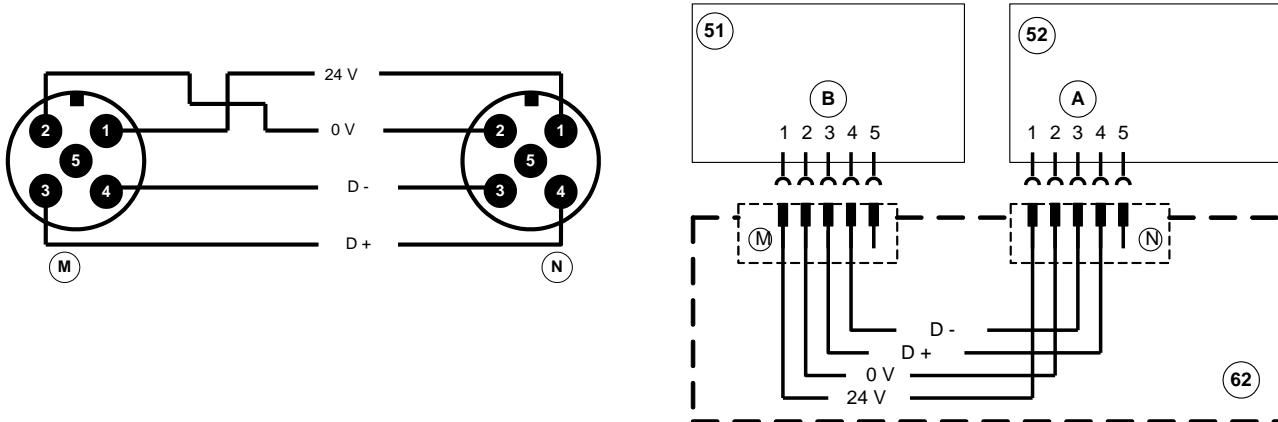

5.3 Crosslink cable

Tailor-made cable:

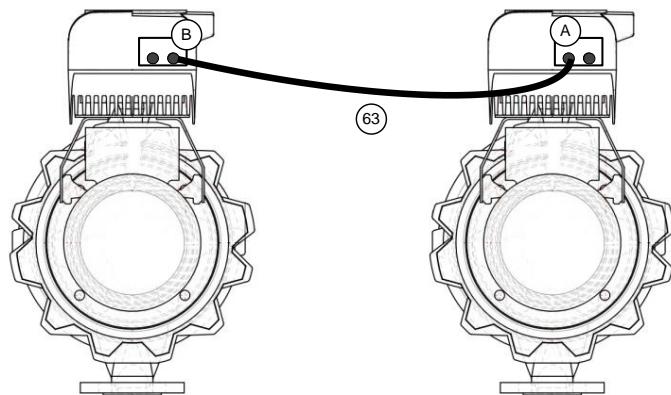

Nr.	function	length	Mat.-Nr.
6	tailor-made cross link bus cable for the redundant connection of PumpMeter (color: black, female: angled, male: angled)	1 m	01533769
		2 m	01533770
		3 m	01533771
		5 m	01533772
		10 m	01533773
		20 m	01533774

Self-made bus cable for the connection for the redundant connection of PumpMeter:

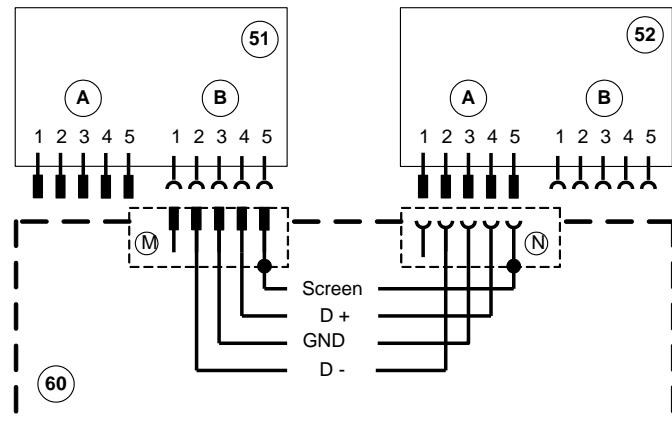

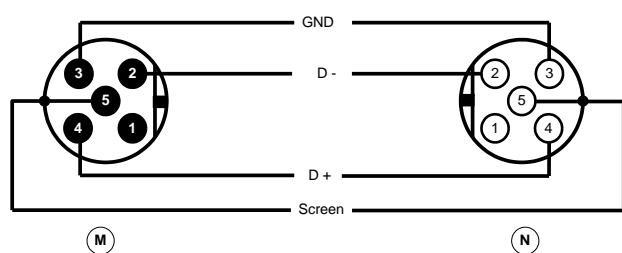

Nr.	function	length	Mat.-Nr.
51	PumpDrive 2 (Drive 1) with M12 Module – Connector B		
52	PumpDrive 2 (Drive 2) with M12 Module – Connector A		
62	CAN-Bus cable cut to length, screened, twisted pair, cable 2 x 2 x 0,22 mm ²	1 m	01111184
		5 m	01304511
		10 m	01304512
		20 m	01304513
M, N	M12 male, A-coded, 5 poles		01523004

5.4 M12 Cable for fieldbus module Modbus RTU

Tailor-made cables are not available due to individual length.

Self-made bus cable for fieldbus module Modbus:

Nr.	function	length	Mat.-Nr.
51	PumpDrive 2 (Drive 1) with Modbus Module – connector B		
52	PumpDrive 2 (Drive 2) with Modbus Module – connector A		
63	CAN-Bus cable cut to length, screened, twisted pair, cable 2 x 0,22 mm ²	1 m 5 m 10 m 20 m	01111184 01304511 01304512 01304513
M	M12 male, B-coded, 5 poles (Binder Connector Type: 99 1437 920 05)		01651264
N	M12 female, B-coded, 5 poles (Binder Connector Type: 99 1436 820 05)		01651298
-	M12 end resistor male for Modbus Alternative: Phoenix Contact male: SAC-5P-M12MS PB TR - 1507803		01125102
