Glossary

Accumulator
Pressure losses may occur in the piping downstream of the pressure booster system as a result of losses due to leakage. The accumulator serves to compensate for pressure losses and minimises the frequency of starts of the pressure booster system.

Certificate of decontamination
A certificate of decontamination is enclosed by the customer when returning the product to the manufacturer to certify that the product has been properly drained to eliminate any environmental and health hazards arising from components in contact with the fluid handled.

Dry running protection
Dry running protection devices prevent the pump from being operated without the fluid to be handled, which would result in pump damage.

IE3
Efficiency class to IEC 60034-30: 3 = Premium Efficiency (IE = International Efficiency)
1 General

1.1 Principles
This operating manual is valid for the type series and variants indicated on the front cover.
The operating manual describes the proper and safe use of this equipment in all phases of operation.
The name plate indicates the type series, the main operating data and the serial number. The serial number uniquely describes the product and is used as identification in all further business processes.
In the event of damage, immediately contact your nearest KSB service facility to maintain the right to claim under warranty.

1.2 Software changes
The software has been specially created for this product and thoroughly tested. Making changes or additions to the software or parts of the software is prohibited. This does not, however, apply to software updates supplied by KSB.

1.3 Installation of partly completed machinery
To install partly completed machinery supplied by KSB refer to the sub-sections under Servicing/Maintenance.

1.4 Target group
This operating manual is aimed at the target group of trained and qualified specialist technical personnel. (☞ Section 2.3, Page 8)

2 Safety

All the information contained in this section refers to hazardous situations. In addition to the present general safety information the action-related safety information given in the other sections must be observed.

2.1 General

- This operating manual contains general installation, operating and maintenance instructions that must be observed to ensure safe operation of the system and prevent personal injury and damage to property.
- Comply with all the safety instructions given in the individual sections of this operating manual.
- The operating manual must be read and understood by the responsible specialist personnel/operators prior to installation and commissioning.
- The contents of this operating manual must be available to the specialist personnel at the site at all times.
- Information and markings attached directly to the product must always be complied with and kept in a perfectly legible condition at all times. This applies to, for example:
  - Arrow indicating the direction of rotation
  - Markings for connections
  - Name plate
- The operator is responsible for ensuring compliance with all local regulations not taken into account.

2.2 Intended use

- The pressure booster system must only be operated within the operating limits described in the other applicable documents.
- Only operate pressure booster systems which are in perfect technical condition.
- Do not operate partially assembled pressure booster systems.
- The pressure booster system must only handle the fluids described in the product literature of the respective design variant.
- Never operate the pressure booster system without the fluid to be handled.
- Observe the information on minimum flow rates specified in the product literature (to prevent overheating, bearing damage, etc).
- Observe the maximum flow rates indicated in the data sheet or product literature (to prevent overheating, cavitation damage, bearing damage, etc).
- Do not throttle the flow rate on the suction side of the pressure booster system (to prevent cavitation damage).
- Consult the manufacturer about any other modes of operation not described in the product literature.

2.3 Personnel qualification and personnel training

- All personnel involved must be fully qualified to install, operate, maintain and inspect the product this manual refers to.
- The responsibilities, competence and supervision of all personnel involved in transport, installation, operation, maintenance and inspection must be clearly defined by the operator.
- Deficits in knowledge must be rectified by means of training and instruction provided by sufficiently trained specialist personnel. If required, the operator can commission the manufacturer/supplier to train the personnel.
- Training on the pressure booster system must always be supervised by specialist technical personnel.
2.4 Consequences and risks caused by non-compliance with this manual

- Non-compliance with these operating instructions will lead to forfeiture of warranty cover and of any and all rights to claims for damages.
- Non-compliance can, for example, have the following consequences:
  - Hazards to persons due to electrical, thermal, mechanical and chemical effects and explosions
  - Failure of important product functions
  - Failure of prescribed maintenance and servicing practices
  - Hazard to the environment due to leakage of hazardous substances

2.5 Safety awareness

In addition to the safety information contained in this operating manual and the intended use, the following safety regulations shall be complied with:

- Accident prevention, health regulations and safety regulations
- Explosion protection regulations
- Safety regulations for handling hazardous substances
- Applicable standards, directives and laws

2.6 Safety information for the operator/user

- Fit protective equipment (e.g. contact guards) supplied by the operator for hot, cold or moving parts, and check that the equipment functions properly.
- Do not remove any protective equipment (e.g. contact guards) during operation.
- Eliminate all electrical hazards. (In this respect refer to the applicable national safety regulations and/or regulations issued by the local energy supply companies.)
- If shutting down the pump does not increase potential risk, fit an emergency-stop control device in the immediate vicinity of the pump (set) during pump set installation.

2.7 Safety information for maintenance, inspection and installation

- Modifications or alterations of the pressure booster system are only permitted with the manufacturer’s prior consent.
- Use only original spare parts or parts authorised by the manufacturer. The use of other parts can invalidate any liability of the manufacturer for resulting damage.
- The operator ensures that maintenance, inspection and installation are performed by authorised, qualified specialist personnel who are thoroughly familiar with the manual.
- Carry out work on the pressure booster system during standstill only.
- The pump casing must have cooled down to ambient temperature.
- Pump pressure must have been released and the pump must have been drained.
- When taking the pressure booster system out of service always adhere to the procedure described in the manual.
- Decontaminate pressure booster systems which handle fluids posing a health hazard.
- As soon as the work has been completed, re-install and/or re-activate any safety-relevant and protective devices. Before returning the product to service, observe all instructions on commissioning.
- Make sure the pressure booster system cannot be accessed by unauthorised persons (e.g. children).
- Prior to opening the device, pull the mains plug and wait for at least 10 minutes.
2.8 Unauthorised modes of operation

Always observe the limits stated in the product literature.

The warranty relating to the operating reliability and safety of the pressure booster system supplied is only valid if the equipment is used in accordance with its intended use. (☞ Section 2.2, Page 8)

2.9 Electromagnetic compatibility (EMC)

2.9.1 Interference emission requirements

The EN 61800-3 EMC product standard is relevant for electric variable speed drives/control systems. It specifies all pertinent requirements and refers to the relevant generic standards for complying with the EMC Directive.

Frequency inverters are commonly used by operators as a part of a system, plant or machine assembly. It should be noted that the operator bears all responsibility for the final EMC properties of the equipment, plant or installation.

A prerequisite or requirement for complying with the relevant standards or the limit values and inspection/test levels referenced by them is that all information and descriptions regarding EMC-compliant installation be observed and followed.

In accordance with the EMC product standard, the EMC requirements to be met depend on the purpose or intended use of the frequency inverter. Four categories are defined in the EMC product standard:

<table>
<thead>
<tr>
<th>Category</th>
<th>Definition</th>
<th>Limits to EN 55011</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1</td>
<td>Frequency inverters with a supply voltage under 1000 V installed in the first environment (residential and office areas).</td>
<td>Class B</td>
</tr>
<tr>
<td>C2</td>
<td>Frequency inverters with a supply voltage under 1000 V installed in the first environment (residential and office areas) that are neither ready to be plugged in/connected nor are mobile and must be installed and commissioned by specialist personnel.</td>
<td>Class A, Group 1</td>
</tr>
<tr>
<td>C3</td>
<td>Frequency inverters with a supply voltage under 1000 V installed in the second environment (industrial environments).</td>
<td>Class A, Group 2</td>
</tr>
<tr>
<td>C4</td>
<td>Frequency inverters with a supply voltage over 1000 V and a nominal current over 400 A installed in the second environment (industrial environments) or that are envisaged for use in complex systems.</td>
<td>No borderline/ boundary1)</td>
</tr>
</tbody>
</table>

The following limit values and inspection/test levels must be complied with if the generic standard on interference emissions applies:

<table>
<thead>
<tr>
<th>Environment</th>
<th>Generic standard</th>
<th>Limits to EN 55011</th>
</tr>
</thead>
<tbody>
<tr>
<td>First environment (residential and office areas)</td>
<td>EN/IEC 61000-6-3 for private, business and commercial environments</td>
<td>Class B</td>
</tr>
<tr>
<td>Second environment (industrial environments)</td>
<td>EN/IEC 61000-6-4 for industrial environments</td>
<td>Class A, Group 1</td>
</tr>
</tbody>
</table>

The frequency inverter meets the following requirements:

<table>
<thead>
<tr>
<th>Power [kW]</th>
<th>Cable length [m]</th>
<th>Category to EN 61800-3</th>
<th>Limits to EN 55011</th>
</tr>
</thead>
<tbody>
<tr>
<td>≤ 11</td>
<td>≤ 5</td>
<td>C1</td>
<td>Class B</td>
</tr>
</tbody>
</table>

The EN 61800-3 standard requires that the following warning be provided for drive systems that do not comply with category C1 specifications:
This product can produce high-frequency interference emissions that may necessitate targeted interference suppression measures in a residential or office environment.

1) An EMC plan must be devised.
2.9.2 Line harmonics requirements

The product is a device for professional applications as defined by EN 61000-3-2. The following generic standards apply when establishing a connection to the public power grid:

- EN 61000-3-2
  for symmetric, three-phase devices (professional devices with a total power of up to 1 kW)
- EN 61000-3-12
  for devices with a phase current of between 16 A and 75 A and professional devices from 1 kW up to a phase current of 16 A.

2.9.3 Interference immunity requirements

In general, the interference immunity requirements for a frequency inverter hinge on the specific environment in which the inverter is installed.

The requirements for industrial environments are therefore higher than those for residential and office environments.

The frequency inverter is designed such that the immunity requirements for industrial environments and, thus, the lower-level requirements for residential and office environments, are met and fulfilled.

The following relevant generic standards are used for the interference immunity test:

- EN 61000-4-2: Electromagnetic compatibility (EMC)
  – Part 4-2: Testing and measurement techniques – Electrostatic discharge immunity test
- EN 61000-4-3: Electromagnetic compatibility (EMC)
  – Part 4-3: Testing and measurement techniques – Radiated, radio-frequency, electromagnetic field immunity test
- EN 61000-4-4: Electromagnetic compatibility (EMC)
  – Part 4-4: Testing and measurement techniques – Electrical fast transient/burst immunity test
- EN 61000-4-5: Electromagnetic compatibility (EMC)
  – Part 4-5: Testing and measurement techniques – Surge immunity test
- EN 61000-4-6: Electromagnetic compatibility (EMC)
  – Part 4-6: Testing and measurement techniques – Immunity to conducted disturbances, induced by radio-frequency fields
3 Transport/Temporary Storage/Disposal

3.1 Checking the condition upon delivery
1. On transfer of goods, check each packaging unit for damage.
2. In the event of in-transit damage, assess the exact damage, document it and notify KSB or the supplying dealer and the insurer about the damage in writing immediately.

3.2 Transport

<table>
<thead>
<tr>
<th>DANGER</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pressure booster system tipping over</strong></td>
</tr>
<tr>
<td>Danger to life from falling pressure booster system!</td>
</tr>
<tr>
<td>▷ Never suspend the pressure booster system by its power cable.</td>
</tr>
<tr>
<td>▷ Do not lift the pressure booster system by its manifold.</td>
</tr>
<tr>
<td>▷ Observe the applicable local accident prevention regulations.</td>
</tr>
<tr>
<td>▷ Observe the information on weights, centre of gravity and fastening points.</td>
</tr>
<tr>
<td>▷ Use suitable and permitted transport equipment, e.g. crane, forklift or pallet jack.</td>
</tr>
</tbody>
</table>

- Transport equipment / lifting equipment suitable for the corresponding weight has been selected and is on hand.
  1. Remove the packaging. Remove the caps from the connection openings.
  2. Check for any in-transit damage.
  3. Transport the pressure booster system to the place of installation.
  4. Detach the pressure booster system from the pallet using a suitable tool.
  5. Attach the pressure booster system to the lifting equipment as illustrated.
  6. Lift it off the wooden skids. Dispose of the wooden skids.
  7. Carefully place down the pressure booster system at the site of installation.

3.3 Storage/preservation

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Damage during storage due to frost, moisture, dirt, UV radiation or vermin</strong></td>
</tr>
<tr>
<td>Corrosion/contamination of pressure booster system!</td>
</tr>
<tr>
<td>▷ Store the pressure booster system in a frost-proof room. Do not store outdoors.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Wet, contaminated or damaged openings and connections</strong></td>
</tr>
<tr>
<td>Leakage or damage of the pressure booster system!</td>
</tr>
<tr>
<td>▷ Only open the openings of the pressure booster system at the time of installation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>NOTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rotate the shaft by hand every three months, e.g. via the motor fan.</td>
</tr>
</tbody>
</table>

If commissioning is to take place some time after delivery, the following measures are recommended when storing the pressure booster system:
Store the pressure booster system in a dry, protected room where the atmospheric humidity is as constant as possible.

**Table 7: Ambient conditions for storage**

<table>
<thead>
<tr>
<th>Ambient condition</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relative humidity</td>
<td>50 % maximum</td>
</tr>
<tr>
<td>Ambient temperature</td>
<td>0 °C to +40 °C</td>
</tr>
</tbody>
</table>

- Frost-free
- Well-ventilated

**3.4 Return to supplier**

1. Drain the pressure booster system as per operating instructions.
2. Always flush and clean the pressure booster system, particularly if it has been used for handling noxious, explosive, hot or other hazardous fluids.
3. If the pressure booster system has handled fluids whose residues could lead to corrosion damage in the presence of atmospheric humidity or could ignite upon contact with oxygen, the pressure booster system must also be neutralised and treated with anhydrous inert gas to ensure drying.
4. Always complete and enclose a certificate of decontamination when returning the pressure booster system. ( ⇒ Section 12, Page 35)
   Always indicate any safety and decontamination measures taken.

**NOTE**

If required, a blank certificate of decontamination can be downloaded from the following web site: [www.ksb.com/certificate_of_decontamination](http://www.ksb.com/certificate_of_decontamination)

**3.5 Disposal**

**WARNING**

Fluids handled, consumables and supplies which are hot and/or pose a health hazard

Hazard to persons and the environment!

- Collect and properly dispose of flushing fluid and any fluid residues.
- Wear safety clothing and a protective mask if required.
- Observe all legal regulations on the disposal of fluids posing a health hazard.

1. Dismantle the pressure booster system.
   Collect greases and other lubricants during dismantling.
2. Separate and sort the pump materials, e.g. by:
   - Metals
   - Plastics
   - Electronic waste
   - Greases and other lubricants
3. Dispose of materials in accordance with local regulations or in another controlled manner.
Electrical or electronic equipment marked with the adjacent symbol must not be disposed of in household waste at the end of its service life. Contact your local waste disposal partner for returns.

If the used electrical or electronic equipment contains personal data, the operator is responsible for deleting it before the equipment is returned.

4.4 Design details

Design

- Fully automatic pressure booster package system
- 2 horizontal centrifugal pumps with frequency inverters
- Baseplate-mounted
- Membrane-type accumulator (direct-flow) to DIN 4807-5 on the discharge side, approved for drinking water, with shut-off element and drain valve.
- Check valve per pump
- Shut-off element upstream and downstream of each pump
- Pressure gauge

Installation

- Stationary dry installation
4 Description

Drive
- Three-phase motor
- To IEC 60034-7
- Efficiency class IE3 to IEC 60034-30 (for three-phase motors ≥ 0.75 kW)
- Frequency 50 Hz/60 Hz (pump frequency = 50 Hz)
- Enclosure IP55

Automation
- Frequency inverter for speed control, IP55, for pressure-controlled starting and stopping
- Function/fault indicated
- Setting the pressure via buttons or via Bluetooth using an app
- Dry running protection

4.5 Configuration and function

Design
The fully automatic pressure booster system pumps the fluid to the consumer installations in the set pressure range using one non-self-priming horizontal high-pressure pump (7).

The fully automatic pressure booster system pumps the fluid to the consumer installations in the set pressure range using one or two non-self-priming horizontal high-pressure pumps (7).

Function
Automatic mode
The pump is controlled and monitored by motor-mounted frequency inverters.

The standard setting is for the pressure booster system to start automatically as a function of pressure; the actual pressure is measured by an analog pressure measuring device (pressure transmitter).

The use of this variable speed pump significantly reduces wear as well as the frequency of pump starts in parallel operation.
If a duty pump fails, a fault is output, which can be reported via volt-free contacts (e.g. to the control station).
If the demand drops towards 0, the pressure booster system slowly runs down to the stop point and stops.
The pressure booster system is designed with dry running protection.
If the pump has not been in operation for 24 hours, a test run is initiated.

**Function**

**Manual mode**

In manual mode, a minimum flow is required to protect the pump against overheating.

### 4.6 Noise characteristics

The pressure booster system is available with different numbers and sizes of pumps. For the noise characteristics refer to the operating manual of the pump set. To calculate the expected total sound pressure level, add a defined value to the individual pump set's expected sound pressure level.

<table>
<thead>
<tr>

</tbody>
</table>

**Example**

Pressure booster system with 4 pump sets (value: + 6 dB(A))

Single pump = 48 dB(A)

48 dB(A) + 6 dB(A) = 54 dB(A)

The expected total sound pressure level of 54 dB(A) may develop when all 4 pump sets are running under full-load conditions.

### 4.7 Scope of supply

The following items are included in the scope of supply:

**Pressure booster system**

- 2 horizontal centrifugal pumps with frequency inverters
- Check valve per pump
- Discharge-side, direct-flow membrane-type accumulator
- Integrated dry running protection

**Control unit**

- Single-phase frequency inverter, motor-mounted

### 4.8 Dimensions and weight

For dimensions and weights please refer to the type series booklet of the pump (set).

### 4.9 Terminal diagram

For the terminal assignment refer to the circuit diagram. ²)

### 4.10 Potential equalisation

A terminal marked with the earth symbol is provided at the power connection for connecting a PE conductor.

---

²) Multiple pump systems only

5 Installation at Site

5.1 Installation
Install pressure booster systems either in the technical equipment room or in a well-ventilated, frost-free, lockable room used for no other purpose. No harmful gases are allowed to enter the installation room. An adequately sized drain (leading to a sewer or equivalent) must be provided.

The pressure booster system is designed for a maximum ambient temperature of 0 °C to +40 °C at a relative humidity of 50%.

**NOTE**
Do not install pressure booster systems next to sleeping or living quarters.

**NOTE**
The installation room must provide for suitable drainage.

If expansion joints (see accessories) are used for damping vibrations, their fatigue strength (endurance limit) must be given due consideration. Expansion joints must be easily replaceable.

5.2 Checks to be carried out prior to installation

**Place of installation**

**WARNING**
Installation on mounting surface which is unsecured and cannot support the load
Personal injury and damage to property!

▷ Use a concrete of compressive strength class C12/15 which meets the requirements of exposure class XC1 to EN 206-1.
▷ The mounting surface must be set, flat, and level.
▷ Observe the weights indicated.

**NOTE**
The anti-vibration mounts of the pressure booster system provide adequate insulation against solid-borne noise. Thanks to level-adjustable feet (KSB accessory) the pressure booster system can also be installed in a horizontal position on uneven floors.

1. All structural work required has been checked and prepared in accordance with the dimensions in the outline drawing.

5.3 Installing the pressure booster system

**WARNING**
Top-heavy pressure booster system
Risk of personal injury by pressure booster system tipping over!

▷ Pressure booster systems awaiting final installation must be secured against tipping over.
▷ Firmly anchor the pressure booster system.
Remove all packaging before installing the pressure booster system. Connect the pressure booster system’s inlet line and discharge line to the corresponding site distribution lines.

**NOTE**
To prevent the transmission of piping forces and solid-borne noise, installing expansion joints with length-limiters is recommended.

Allow sufficient space for maintenance and repair work.
- All structural work required has been checked.
- The dimensions of the concrete foundation are correct, and the concrete has set firmly.

1. Mark out the anchoring holes on the floor as shown in the outline drawing.
2. Drill the holes (max. diameter: 12 mm).
3. Insert plug fixings of appropriate size.
4. Place the pressure booster system in its correct installation position.
5. Use suitable bolts to firmly anchor the pressure booster system.

### 5.4 Connecting the piping

**CAUTION**

Air pockets in suction line
Pressure booster system cannot prime!

▷ Lay the pipe with a continuously rising slope.

1. Suction lift operation

1. Mechanically support the suction head line on site to provide for absorption of mechanical forces.
2. Install the piping without transmitting any stresses and strains.
3. Connect the piping to the distribution lines on the inlet side and discharge side.

**NOTE**
For single-pump systems, the shut-off valves must be fitted directly at the system’s suction-side connection and discharge-side connection, respectively. This will enable straightforward replacement and servicing.

### 5.4.1 Fitting an expansion joint

**DANGER**
Sparks and radiant heat
Fire hazard!

▷ Take suitable precautions to protect the expansion joint if any welding work is carried out nearby.
5 Installation at Site

CAUTION

Wet, contaminated or damaged openings and connections
Damage to the pressure booster system!
▷ Do not open the pressure booster system openings until just prior to installation.

✓ The expansion joint has a length limiter with solid-borne sound insulation so as to be able to absorb reaction forces.
1. Install the expansion joint in the piping free of twist or distortion. Never use the expansion joint to compensate for misalignment or mismatch of the piping.
2. Tighten the bolts evenly and crosswise during assembly. The ends of the bolts must not protrude from the flange.
3. Do not apply paint to the expansion joint. Protect it from any contact with oil.
4. The position of the expansion joint within the pressure booster system must allow easy access and inspection and it must, therefore, not be insulated along with the piping.
5. Expansion joints are subject to wear.

5.5 Installing unpressurised inlet tanks

Installation and location of an unpressurised inlet tank together with the pressure booster system are governed by the same rules applicable to the pressure booster system.
Install the closed tank (under atmospheric pressure) available from us as an accessory as described in the installation instructions supplied with the tank.

CAUTION

Contamination in the pressure booster system
Damage to the pumps!
▷ Clean the tank before filling it.

The tank must be connected mechanically and electrically to the pressure booster system prior to commissioning of the system.

5.6 Electrical connection

WARNING

Incorrect connection to the mains
Damage to the mains network, short circuit!
▷ Observe the technical specifications of the local energy supply companies.

Connection to power supply of the dual-pump systems is effected at the master switch by connecting L1, L2 and N, both for 3~400 V+N, or 1~230 V. Site-supplied fusing: 32 A (max).

NOTE

In individual cases, an earth leakage circuit breaker may trip when the pressure booster system is first commissioned. This may be caused by total discharge of the intermediate circuit.

5.6.1 Sizing the power cable

The cross-section of the power cable must be sized for the total rated power requirement.
5.6.2 Connecting the external dry running protection device (optional)

- An M12 plug is included in the scope of supply (the pressure booster system has a connection for an external, operator-supplied dry running protection device.)

**NOTE**

**Pressure booster system does not start up**
If the pressure booster system is equipped with a connection for an external dry running protection device, an external, operator-supplied dry running protection device must be connected. When the external dry running protection device (e.g. float switch) is not connected, the pressure booster system will not start.

1. Connect the cores of the external dry running protection device at pin 2 and pin 4 of the M12 plug. The contact must be a normally closed contact.

![Diagram of M12 plug connections](fig5)

**Fig. 5:** Connecting the external dry running protection equipment

</table>
6 Commissioning/Start-up/Shutdown

6.1 Commissioning/Start-up

6.1.1 Prerequisites for commissioning/start-up

Before commissioning/start-up of the pressure booster system make sure that the following requirements are met:

▪ The pressure booster system has been properly connected to the electric power supply and is equipped with all protection devices.

▪ All relevant VDE standards and/or regulations applicable in the country of use are complied with.

**NOTE**

The competent authorities must be informed in due time prior to commissioning/test running the system.

6.1.2 Commissioning/start-up of pressure booster system

**CAUTION**

Foreign matter in the piping
Damage to the pump set / pressure booster system!

▷ Before commissioning/starting up or functional check running the pressure booster system, make sure that there is no foreign matter in the pressure booster system or piping.

**NOTE**

Commissioning of the pressure booster system - even test running - shall only be carried out in full compliance with all pertinent VDE (German Association of Electrical Engineers) regulations.

**NOTE**

In individual cases, an earth leakage circuit breaker may trip when the pressure booster system is first commissioned. This is caused by total discharge of the intermediate circuit.

- The pipe unions between the pump and the piping have been re-tightened.
- The cooling air inlet and outlet openings on the motor are unobstructed.
- All shut-off valves of the pressure booster system are open.
- The pre-charge pressure of the membrane-type accumulator has been checked. (⇒ Section 8.2.3, Page 30)

1. Open or loosen the vent plugs on the pump (refer to the pump’s installation/operating manual).
2. Slowly open the inlet-side shut-off element and prime the pressure booster system until the fluid to be handled escapes through all vent holes.
3. Insert and slightly tighten the pump vent plugs.
4. Plug in the mains plug or set the master switch to I.
5. Close the discharge-side shut-off element slowly and check whether the pressure booster system stops.
6. Run the pump again, with the discharge-side shut-off element open, and loosen the vent plug to let any remaining air escape.
7. Then re-tighten the vent plug firmly.
6 Commissioning/Start-up/Shutdown

8. Verify that the pump is running smoothly.
9. Close the discharge-side shut-off element in order to verify whether the pump reaches its maximum shut-off head.
10. Make sure that the dry running protection device is working properly.

NOTE
Minor leakage of the mechanical seals during commissioning is normal and will cease after a short period of operation.

6.2 Switching on the pressure booster system
Plug in the mains plug or set the master switch to I to energise the pump. Readiness for operation is signalled by a permanently lit red LED and a flashing green LED.

6.3 Checklist for commissioning/start-up

<table>
<thead>
<tr>
<th>Table 11: Checklist</th>

</tr>
<tr>
<td>12</td>
</tr>
</tbody>
</table>

6.4 Shutdown

NOTE
As long as the pressure booster system is out of operation, water is supplied directly at $p_{in}$ through the pressure booster system.
The pressure booster system remains installed
✓ Sufficient fluid handled is supplied for the operation check run of the pressure booster system.

1. Pull the mains plug or set the master switch to 0.

<table>
<thead>
<tr>
<th>DANGER</th>
</tr>
</thead>
</table>
| **Voltage at the pressure booster system**  
**Danger to life!**  
▷ Prior to opening the device, wait at least 10 minutes for any residual voltage to dissipate. |

2. Start up the pressure booster system regularly between once a month and once every three months for approximately five minutes during prolonged shutdown periods.  
This will prevent the formation of deposits within the pump and the pump intake area.

The pressure booster system is removed from the pipe and stored
✓ The pressure booster system has been properly drained.

1. Spray-coat the inside wall of the pump casings, and in particular the impeller clearance areas, with a preservative.

2. Spray the preservative through the suction and discharge nozzles.  
It is advisable to then close the pump nozzles (e.g. with plastic caps or similar).

3. Oil or grease all exposed machined parts and surfaces of the pressure booster system to protect them against corrosion.
7 Operating the Pressure Booster System

CAUTION
Incorrect operation
Water supply is not assured!
▷ Make sure to comply with all local regulations, particularly the EC Machinery Directive and the EC Directive on Low-Voltage Equipment.

7.1 Design of the frequency inverter
The frequency inverter is motor-mounted and self-cooling. Its display and control panel feature the following:

![Fig. 6: KSB Delta Compact display and control panel](image)

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>

</tbody>
</table>

7.3 Programming
The red stand-by LED (1) lights up when the pressure booster system is energised.
The green SET LED (5) starts flashing to indicate that the system is ready for operation.
Press the Start/Stop button to start the pump. The green operating status LED (2) starts flashing at different frequencies. The closer the measured pressure to the set pressure, the higher the flashing frequency.
When the set value is reached, the green operating status LED (2) is lit continuously.
To stop the pump press the Start/Stop button (4). The green operating status LED (2) extinguishes.

Adjusting the pressure
A pressure gauge is fitted in the discharge line. Slightly opening one of the consumer installations facilitates pressure adjustment.

Adjusting the pressure
- Start up the pump (press the Start/Stop button).
- If the Set LED (5) flashes, press the Plus button or Minus button until the Set LED lights up continuously.
- Set the pressure by pressing the Plus button or Minus button as required.
8 Servicing/Maintenance

8.1 General information/Safety regulations

**DANGER**

Unintentional start-up of pressure booster system
Danger to life!
▷ De-energise the pressure booster system for any repair work or servicing work.
▷ Ensure that the pressure booster system cannot be re-energised unintentionally.

**DANGER**

Voltage at the pressure booster system
Danger to life!
▷ Prior to opening the device, wait at least 10 minutes for any residual voltage to dissipate.

**WARNING**

Improper lifting/moving of heavy assemblies or components
Personal injury and damage to property!
▷ Use suitable transport devices, lifting equipment and lifting tackle to move heavy assemblies or components.

**WARNING**

Unintentional start-up of pressure booster system
Risk of injury by moving parts!
▷ Make sure the pressure booster system has been de-energised before commencing work on the pressure booster system.
▷ Make sure that the pressure booster system cannot be started up unintentionally.

**WARNING**

Unqualified personnel performing work on the pressure booster system
Risk of personal injury!
▷ Always have repair and maintenance work performed by specially trained, qualified personnel.

**CAUTION**

Incorrectly serviced pressure booster system
Function of pressure booster system not guaranteed!
▷ Regularly service the pressure booster system.
▷ Prepare a maintenance schedule for the pressure booster system, with special emphasis on lubricants, shaft seals and pump couplings.
The operator ensures that maintenance, inspection and installation are performed by authorised, qualified specialist personnel who are thoroughly familiar with the manual.

- Observe the safety instructions and information.
- For any work on the pump (set) observe the operating manual of the pump (set).
- In the event of damage you can always contact KSB Service.
- A regular maintenance schedule will help avoid expensive repairs and contribute to trouble-free, reliable operation with a minimum of maintenance expenditure and work.
- Never use force when dismantling and reassembling the equipment.

8.2 Servicing/Inspection

8.2.1 Supervision of operation

**CAUTION**

Increased wear due to dry running
Damage to the pump set!

- Never operate the pump set without liquid fill.
- Never close the shut-off element in the suction line and/or supply line during pump operation.

**CAUTION**

Impermissibly high temperature of fluid handled
Damage to the pump!

- Prolonged operation against a closed shut-off element is not permitted (heating up of the fluid).
- Observe the temperature limits in the data sheet and in the section on operating limits.

While the pump is in operation, observe and check the following:

- If activated, check the functional check run.
- Measure the actual start-up pressure and stop pressure of the pump sets with a pressure gauge. Compare the values with the specifications on the name plate.
- Compare the pre-charge pressure of the accumulator with the recommended data. (Refer Section 8.2.3, Page 30)
- Check the rolling element bearings for running noises. Vibrations, noise and an increase in current input occurring during unchanged operating conditions indicate wear.
- Monitor the functions of auxiliary connections, if any.

8.2.2 Maintenance schedule

Table 13: Overview of maintenance work

<table>

</tr>
</tbody>
</table>

### 8.2.3 Setting the pre-charge pressure

#### WARNING

Wrong gas
Danger of poisoning!
▷ Use only nitrogen to charge the accumulator.

#### CAUTION

Pre-charge pressure too high
Damage to the accumulator!
▷ Observe the manufacturer's product literature (see name plate or operating manual of the accumulator).

The accumulator's pre-charge pressure ($p$) must be lower than the set start-up pressure ($p_E$) of the pressure booster system.

The best storage volumes are achieved with the following settings (mean value):

- **Value 0.9 at start-up pressure > 3 bar**
- **Value 0.8 at start-up pressure < 3 bar**

**Example 1**

$p_E = 5$ bar

$5\text{ bar} \times 0.9 = 4.5\text{ bar}$

With a start-up pressure of 5 bar the pre-charge pressure of the accumulator must be 4.5 bar.

**Example 2**

$p_E = 2$ bar

$2\text{ bar} \times 0.8 = 1.6\text{ bar}$

With a start-up pressure of 2 bar the pre-charge pressure of the accumulator must be 1.6 bar.

### Checking the pre-charge pressure

1. Close the shut-off elements fitted underneath the membrane-type accumulator.
2. Drain the membrane-type accumulator via the drain valve.
3. Remove and store the protective cap of the membrane-type accumulator valve.
4. Check the pre-charge pressure using suitable equipment (e.g. tyre pressure gauge).
5. Fit the protective cap of the membrane-type accumulator valve.

### Filling the membrane-type accumulator

1. Remove and store the protective cap of the membrane-type accumulator valve.
2. Add nitrogen through the valve.
3. Fit the protective cap of the membrane-type accumulator valve.
### 9 Trouble-shooting

**NOTE**

Before performing any work on the pump’s internal parts during the warranty period please always consult the manufacturer. Our after-sales service will be at your disposal. Non-compliance will lead to forfeiture of any and all rights to claims for damages.

11 EU Declaration of Conformity

Manufacturer: KSB B.V.
Kalkovenweg 13
2401 LJ Alphen aan den Rijn (The Netherlands)

The manufacturer herewith declares that the product:

KSB Delta Basic Compact (MVP)

Serial number: 06/2018 0000000-0001 - 52/2020 9999999-9999

- is in conformity with the provisions of the following Directives as amended from time to time:
  - Pump set: 2006/42/EC Machinery Directive
  - Electrical components: 2011/65/EU Restriction of the use of certain hazardous substances in electrical and electronic equipment (RoHS)
  - 2014/30/EU: Electromagnetic Compatibility (EMC)

The manufacturer also declares that

- the following harmonised international standards have been applied:
  - ISO 12100
  - EN 809
  - EN 60204-1
  - EN 806-2

Please tick where applicable:

☐ Corrosive
☐ Oxidising
☐ Flammable
☐ Explosive
☐ Hazardous to health

☐ Seriously hazardous to health
☐ Toxic
☐ Radioactive
☐ Bio-hazardous
☐ Safe

Reason for return: ........................................................................................................
Comments: ................................................................................................................
........................................................................................................................................

The product/accessories have been carefully drained, cleaned and decontaminated inside and outside prior to dispatch/placing at your disposal.
We herewith declare that this product is free from hazardous chemicals, biological and radioactive substances.
For mag-drive pumps, the inner rotor unit (impeller, casing cover, bearing ring carrier, plain bearing, inner rotor) has been removed from the pump and cleaned. In cases of containment shroud leakage, the outer rotor, bearing bracket lantern, leakage barrier and bearing bracket or intermediate piece have also been cleaned.
For canned motor pumps, the rotor and plain bearing have been removed from the pump for cleaning. In cases of leakage at the stator can, the stator space has been examined for fluid leakage; if fluid handled has penetrated the stator space, it has been removed.
☐ No special safety precautions are required for further handling.
☐ The following safety precautions are required for flushing fluids, fluid residues and disposal:
........................................................................................................................................
........................................................................................................................................

We confirm that the above data and information are correct and complete and that dispatch is effected in accordance with the relevant legal provisions.

13 Commissioning Report

The pressure booster system specified below has been commissioned today by the undersigned, authorised KSB Service who created this report.

### Pressure booster system details

<table>
<thead>
<tr>
<th>Type series</th>
<th>Size</th>
<th>Serial number</th>
<th>Order No.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
